Active House

Edifici che producono più di quanto consumano

Presentato da: Marco Imperadori

Contacts:
Kurt Emil Eriksen,
General Secretary
Active House Alliance,

Active House

L'origine del progetto

Piano EU 2020

- 20% Riduzione CO₂
- 20% Energia rinnovabile
- 20% Efficienza energetica

Direttive sulle prestazioni energetiche degli edifici (2010)

- Edifici a energia quasi zero (NZEB)
- Piani nazionali di attuazione

Applicazioni a livello nazionale (2011=>)

- Interpretazione della normativa NZEB
- Metodologia di sviluppo
- Aggiornamento legislativo e dei requisiti edilizi

Active House

La situazione attuale

40% dell'energia mondiale

- viene utilizzata per il riscaldamento e il raffrescamento degli edifici
- il 90% del patrimonio edilizio attuale sarà ancora in uso nel 2050

Trascuriamo il 90% del nostro tempo

- all'interno di edifici,
- almeno il 30% degli edifici non offre un clima interno sano

Le sfide climatiche si giocano a livello globale

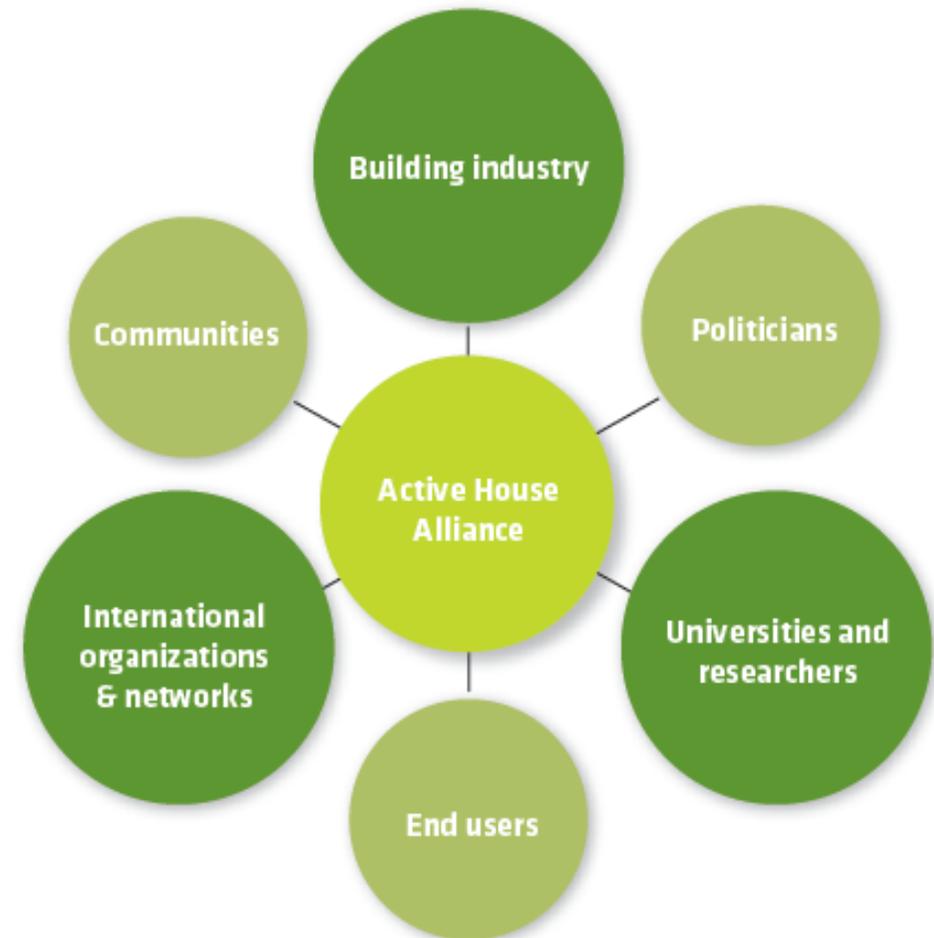

- le risorse sono limitate
- i rifiuti aumentano

E' ora di agire!

Le tecnologie già esistenti possono fare la differenza!

Active House Alliance

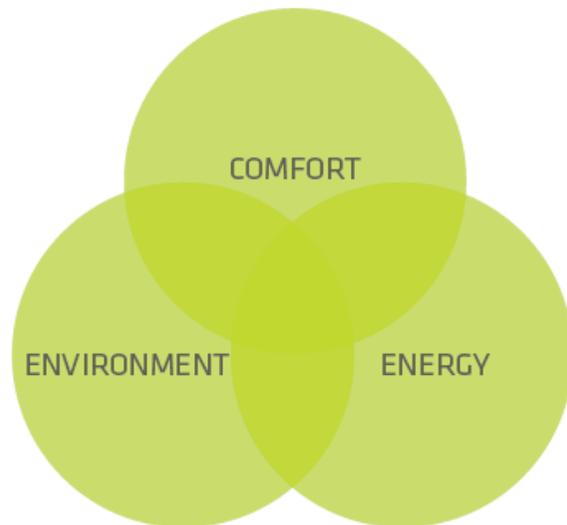

Partner e target groups

Active House: la visione

Edifici che producono più di quanto consumano

L'idea su cui si basa il concetto di Active House è quella di realizzare edifici che permettono una vita sana e confortevole a chi li abita, senza impattare in modo negativo sul clima.

Comfort

– *Crea condizioni abitative migliori*

Una Active House offre ai suoi abitanti un clima interno più sano e confortevole, apportando luce naturale e ventilazione. I materiali utilizzati non impattano negativamente sul comfort e sul clima interno.

Energia

– *Permette agli edifici di ottenere un bilancio energetico positivo*

Una Active House è un edificio ad alta efficienza energetica. Tutta l'energia necessaria al suo funzionamento deriva da fonti di energia rinnovabili integrate nell'edificio stesso o da vicini impianti collettivi di energia.

Ambiente

– *Ha un impatto positivo sull'ambiente*

Una Active House interagisce in modo positivo con l'ambiente circostante, inserendosi in maniera ottimale all'interno del contesto locale, grazie a un uso attento delle risorse e a un basso impatto ambientale durante il suo intero ciclo di vita.

Active House: approfondimenti

Edifici che producono più di quanto consumano

Criteri quantitativi

Classificazione: 1 (migliore) – 4 (accettabile)

Comfort

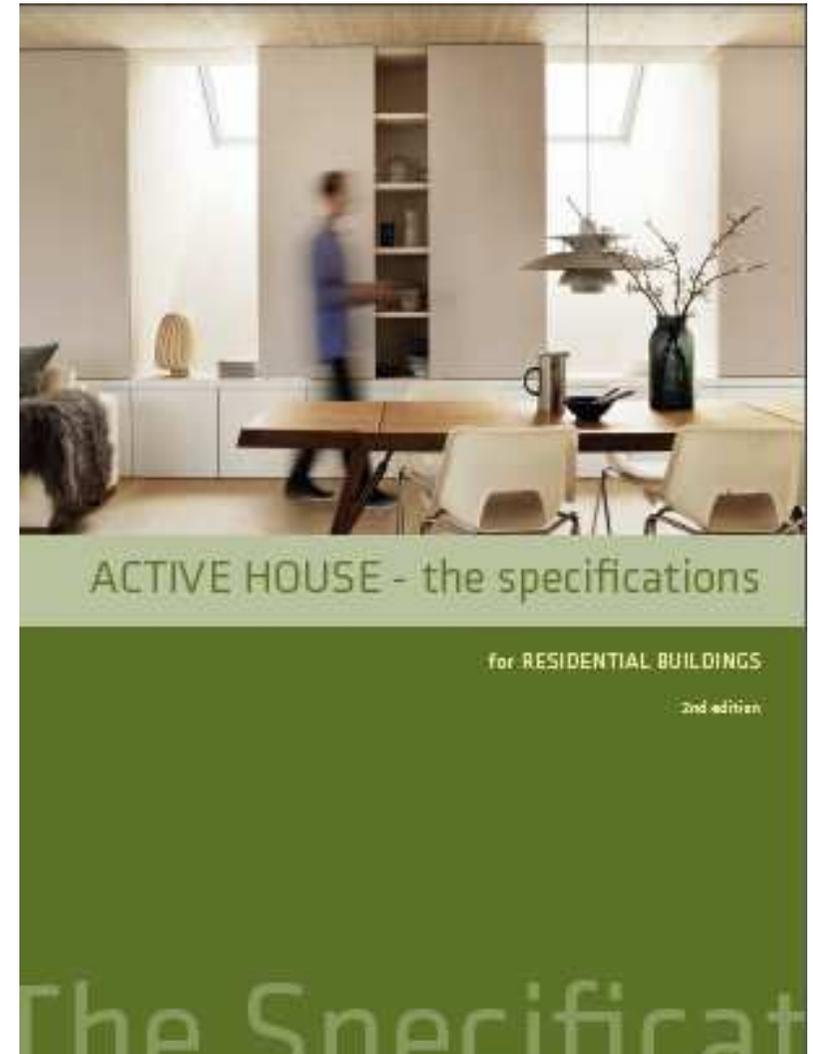

- Luce Naturale
- Temperatura degli ambienti
- Qualità dell'aria all'interno degli ambienti

Energia

- Consumo energetico
- Fornitura energetica
- Prestazione energetica

Ambiente

- Carico ambientale
- Consumo di acqua
- Edilizia sostenibile

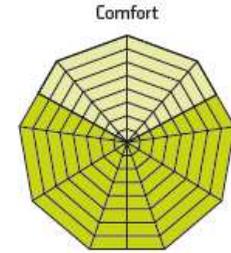

Active House: approfondimenti

Prestazioni nel diagramma radar

Active House: approfondimenti

Comfort

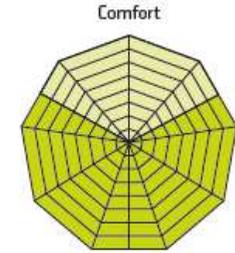

Trascurriamo il 90% del nostro tempo in ambienti chiusi; di conseguenza la qualità del clima interno ha un impatto significativo sulla nostra salute e sul nostro comfort.

Un clima interno sano è una caratteristica fondamentale di una Active House. Il design stesso dell'edificio deve permettere di ottenere buone condizioni di illuminazione naturale, un buon comfort termico e una buona qualità dell'aria. Per ottenere questi risultati è importante rispettare determinati dettagli costruttivi.

Active House: approfondimenti

Comfort

Luce Naturale

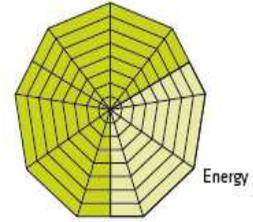

PARAMETER	VALUE	CRITERIA	SCORE
1.1.1 Daylight factor		<p>The amount of daylight in a room is evaluated through average daylight factor levels on a horizontal work plane:</p> <ol style="list-style-type: none"> 1. DF > 5% on average 2. DF > 3% on average 3. DF > 2% on average 4. DF > 1% on average <p>Daylight factors are calculated using a validated daylight simulation program.</p>	
1.1.2 Direct sunlight availability		<p>For minimum one of the main habitable rooms, sunlight provision should be available between autumn and spring equinox:</p> <ol style="list-style-type: none"> 1. At least 10% of probable sunlight hours 2. At least 75% of probable sunlight hours 3. At least 5% of probable sunlight hours 4. At least 2.5% of probable sunlight hours <p>The evaluation is made according to British Standard BS 8206-2:2008 "Lighting for buildings – Part 2: Code of practice for daylight".</p>	
TOTAL AVERAGE:			

Temperatura degli ambienti

PARAMETER	VALUE	CRITERIA	SCORE
1.2.1 Maximum operative temperature		<p>The maximum indoor temperature limits apply in periods with an outside T_{out} of 12°C or more.</p> <p>For living rooms, kitchens, study rooms, bedrooms etc. in dwellings without mechanical air conditioning and with adequate opportunities for natural (cross or stack) ventilation, the maximum indoor operative temperatures are:</p> <ol style="list-style-type: none"> 1. $T_{in} < 0.33 \times T_{out} + 20.8^\circ\text{C}$ 2. $T_{in} < 0.33 \times T_{out} + 21.8^\circ\text{C}$ 3. $T_{in} < 0.33 \times T_{out} + 22.8^\circ\text{C}$ 4. $T_{in} < 0.33 \times T_{out} + 23.8^\circ\text{C}$ <p>T_{out} is the Running Mean outdoor temperature as defined in chapter 3.4 External temperature, running mean of EN 15251:2007.</p> <p>For living rooms etc. in residential buildings with air conditioning, the maximum operative temperatures are:</p> <ol style="list-style-type: none"> 1. $T_{in} < 25.5^\circ\text{C}$ 2. $T_{in} < 26^\circ\text{C}$ 3. $T_{in} < 27^\circ\text{C}$ 4. $T_{in} < 28^\circ\text{C}$ <p>For bedrooms (especially at night time), a 2°C lower value should preferably be used than indicated above as people are more sensitive to high temperatures when sleeping or trying to fall asleep. Also, in kitchens higher temperatures than indicated can be allowed periodically, e.g. during cooking activities.</p> <p>The system should be designed to achieve the values, the users can however choose other settings.</p> <p>Reference: EN 15251:2007.</p>	
1.2.2 Minimum operative temperature		<p>The minimum indoor temperature limits apply in periods with an outside T_{out} of 12°C or less.</p> <p>For living rooms, kitchens, study rooms, bedrooms etc. in dwellings, the minimum operative temperatures are:</p> <ol style="list-style-type: none"> 1. $T_{in} > 21^\circ\text{C}$ 2. $T_{in} > 20^\circ\text{C}$ 3. $T_{in} > 19^\circ\text{C}$ 4. $T_{in} > 18^\circ\text{C}$ <p>The system should be designed to achieve the values, the users can however choose other settings.</p>

Ambiente

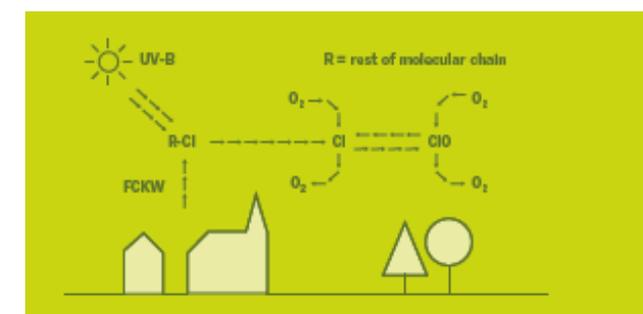

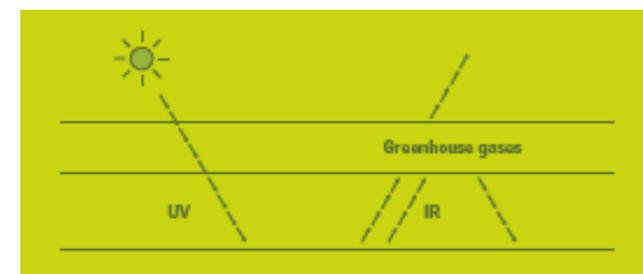

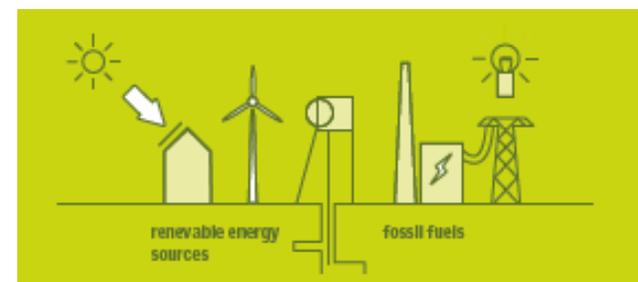

Environment

Le sfide che affrontiamo in ambito ambientale si giocano a livello locale, regionale e globale.

Nella progettazione di una Active House è importante che tali sfide vengano prese in considerazione. Soprattutto con l'obiettivo di ottenere una nuova generazione di edifici con un impatto positivo sull'ambiente.

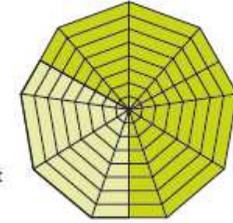

Già in fase di progettazione dovrebbero essere fatte delle considerazioni in merito a come le Active House utilizzano materiali edilizi e risorse.

Strumento a disposizione degli associati

The screenshot shows the 'Active House - Evaluation_tool_v20130424 - Microsoft Excel' spreadsheet. The main data table is titled 'Energy demand, energy supply, Energy balance' and is organized into sections for Space heating and Domestic Hot Water. The table has five columns: Energy demand/production [kWh], Primary Energy conversion [-], Primary Energy [kWh], and Primary Energy [kWh/m2].

	Energy demand / production [kWh]	Primary Energy conversion [-]	Primary Energy [kWh]	Primary Energy [kWh/m2]
Space heating				
Total heat requirement space heating	6,460.0			
Coverage of space heating demand				
Heat pump				
Heat production heat pump (space heating)	6,460.0			
yearly COP for space heating	2.69			
Electrical consumption heat pump	2,401.5	2.50	6,003.7	31.6
District Heating	0.0	0.80	0.0	0.0
Boiler	0.0	1.00	0.0	0.0
Electric heating	0.0	2.50	0.0	0.0
Total primary energy consumption Space heating				31.6
Electricity consumption space heating				
Pumps	300.0	2.50	750.0	3.9
Others	190.0	2.50	475.0	2.5
			1,225.0	6.4
Domestic Hot Water				
DHW heat requirement				
Energy content hot water consumption	710.0			

Annotations on the right side of the spreadsheet provide detailed instructions for data entry:

- Top annotation:** Please specify the energy demand of your building for the different categories listed. Please note that only the blue numbers required your input. The energy demand needs to be specified using the actual energy consumption (kWh). The primary energy conversion needs to be updated according to local regulations/standards. In case you have any additional comments, please feel free to use any of the unused cells..
- Second annotation:** Normalized measured energy demand for space heating. Energy produced by solarpanels for space heating. If it is not possible to clarify the part of solar heating used for room heating, the total energy produced by HP and solar heating can be typed under "heat production heatpump (space heating)". And the yearly COP for space heating can be written as the COP including the Solar heating production. In case the yearly COP for room heating is not know, the total COP of the heating system can be used
- Third annotation:** Primary energy conversion factor (related to local / national standards)
- Fourth annotation:** Electrical consumption of all pumps related to room heating, that is not already part of the COP of the heat pump
- Fifth annotation:** Other electricity related to room heating. In case of overheating of the solar storage tank, the energy consumption for cooling the tank must be typed here
- Sixth annotation:** Energy consumption for hot water
- Seventh annotation:** Storage & distribution losses. In the actual case HFL, the losses

Active House

Great Gulf Active House

Active House

Ristrutturazione Montfoort

Project description

Building name:	De Poorters van Montfoort
Building type:	10 terraced single-family homes
Location:	Montfoort, the Netherlands
Active House evaluation basis:	Renovation
No. of storeys and areas:	3 floors
Heated floor area:	Gross m ² 131 m ² Net m ² 122 m ²
Primary constructions:	Internal and external walls of bricks. Bearing interior walls of concrete. Concrete slabs.
Primary heating supply:	Electricity
Heating system:	Water-water heat pump supplemented by thermal solar collectors
Renewable energy:	Thermal solar collectors and heat pump for hot water supply and room heating. PV for electricity generation.

Active House

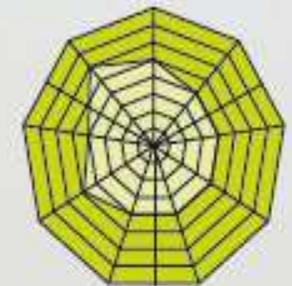

Ristrutturazione Montfoort

The general Active House Radar is calculated based on the performance before and after the renovation.

UPCOMING EVENTS

Join us on October 30: Symposium Sustainable comfort in buildings in Budapest!

The topic of this year's Active House symposium is the development of nearly zero-energy buildings and the long term political targets for sustainable buildings in Europe. The talks are divided into three sessions:

- political targets and the human need for sustainable buildings with healthy comfort
- an overview of the Hungarian experience and examples of local projects
- a presentation of the Active House specifications and examples of international green architecture.

The symposium will end with a plenary debate on sustainable buildings with focus on human well-being and comfort. Complete program. Participation fee: € 39,00. To register.

October 24: Webinar Multi-Comfort House in Belarus on the architect, Alexander Kucheravy, about his process behind the design of the house. The Multi-Comfort House in Belarus is an international project implemented by SAINT-GOBAIN, VELUX Belarus, and Karkasnyy Dom (Modern Frame House LLC) and designed by Belarusian architect Alexander Kucheravy. The house was opened for visitors on 23 May 2013. Find more information about the The Multi-Comfort House in Belarus here. Date and time: 24 October from 15.00 – 16.00 CET. Send us an e-mail at secretariat@activehouse.info if you wish to follow the webinar.

Nordic Passiv House conference

The Active House Alliance participates at the sixth Passivhus Norden conference where Nordic and European experts will meet, present and discuss the latest developments, future possibilities and barriers to overcome within low energy buildings. The conference will take place from October 15-17 and include a presentation by Carsten Østergaard Pedersen on the Active House vision for buildings.

NEWS

Active House open in Canada

The Great Gulf Active House in Canada opens on October 16. Niels Bohr Abramsen, the Danish ambassador to Canada will be the guest of honor at this official opening. Follow the building through LIVE updates. If you wish to attend RSVP to activehouse@greatgulf.com.

Active House Alliance nominated in Denmark

The national Danish radio and the newspaper "Information" launched a national project with the purpose of sharing knowledge about sustainable projects which are initiated by citizens, businesses and organisations. More than 400 projects were presented. The Active House Alliance made it to the final round as one of 27 projects.

CESBA

CESBA is on the one hand a methodology to assess existing and new buildings and on the other hand a framework of EU projects to reach higher convergence by a common process. Active House will participate in the next workshop to be organized in October on the 21-23 in Austria.

Sustainable Buildings: an EU Commission initiative

The European Commission wants to gather views and additional information on the possible introduction of EU wide measures to achieve better environmental performance of buildings. The Active House Alliance has given comments, input and additional information to the European Commission.

Busy summer

During the summer, the Active House Alliance gave presentations and organized side events at several European conferences on sustainable buildings. Among others: CLIMA2013 and SB13 both organized in Prague, The Ventilative Cooling conference in Athens, as well as being present at PLEA in Munich.
